

Identify biological process.

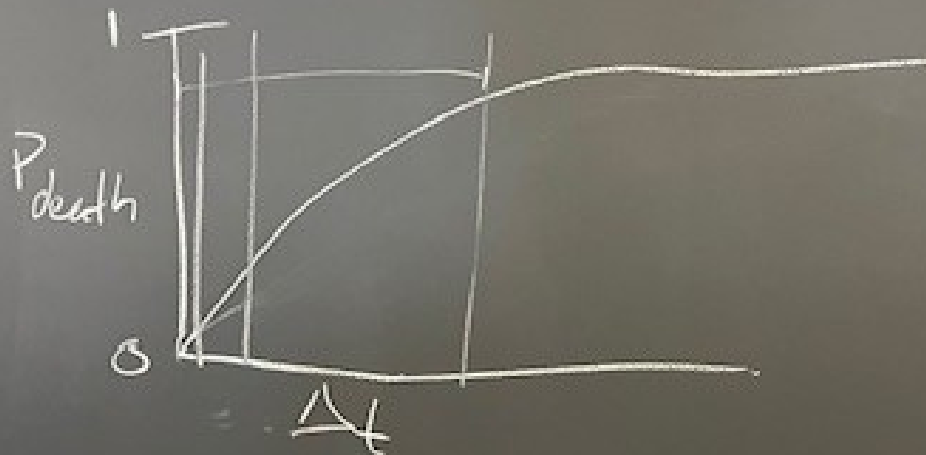

Make an algorithm

Put algorithm in a function.

Simulation study

Emergent outcomes (histogram).

$$P_e(\text{event occurs} | \Delta t) = m \Delta t.$$

Parameterization: different form of the same model.

Which event?

$$\Pr(\text{prey}) = \frac{s}{s+m} \quad \frac{s\Delta t + m\Delta t}{(s+m)\Delta t}$$

$$\Pr(\text{death}) = \frac{m}{s+m}$$

$$= 1 - \Pr(\text{prey})$$
